

# Oil/Water Separators

## What it is!

- ▶ Any compressed air system produces condensate mixed with oil and other substances.
- ▶ These condensates are removed from the system through purges to prevent them from reaching the point of consumption.
- ▶ To properly manage this contaminated condensate, the oil/water separators are installed.
- ▶ The purpose of these is to filter the condensate in order to dispose the water and retain the oil with particles in a container to be properly recycled and avoid environmental pollution.
- ▶ This filtration is carried out thanks to a combination of filters and activated carbon, which have a limited lifetime.

## Why important to service!

- ▶ Ensure a proper filtration of the condensate
- ▶ Reduce operational costs
- ▶ Increased productivity & profitability
- ▶ Replace in time to avoid saturating the oil/water separator

## Protect your environment

- ▶ **Companies have the legal responsibility** to duly manage the contaminated waste.
- ▶ It is mandatory by European laws. e.g. Spain has the dedicated “Law of Environmental Responsibility 26/2007” that establishes fines for those companies who fail to manage the residues and contaminate the environment.
