设计原理 Operating Principle

体积减少压力增加:静态压缩系统

体积少压力增加是旋片式运行的原理。这种静态设计可以在真空，压力和两者结合的应用中产生良好的效果。根据规格和构造，例如油润滑式和无油式，真空度可达0.1mbar，流量从3到1535m³/hr；压力达1.5bar，流量从3到155m³/hr。当同时应用于真空和压力时，可同时达到0.6bar的真空度和0.7bar的正压。

在圆柱体的泵腔（1）内，转子（2）是偏心安装的，紧靠顶部几乎与缸体接触，转子叶片（4）安装在众多的转子槽（3）中。当转子开始转动，由于离心力的作用叶片抛出后沿缸体内部滑动。这样，两个叶片之间形成一个气室，其体积随着转动不断改变。当后面的叶片到达进气口（7）时，气体从进气口进入气室，在这时，气室（5）达到其最大的容积。当气室移动，其容积越来越小，气体被压缩，压强增加，直到气室（8）内的气体压强超过腔体（9）内的压强时，气体从出气口（10）排出。有些型号安装了单向阀（11）用于防止达到极限压强时排出的气体回流。

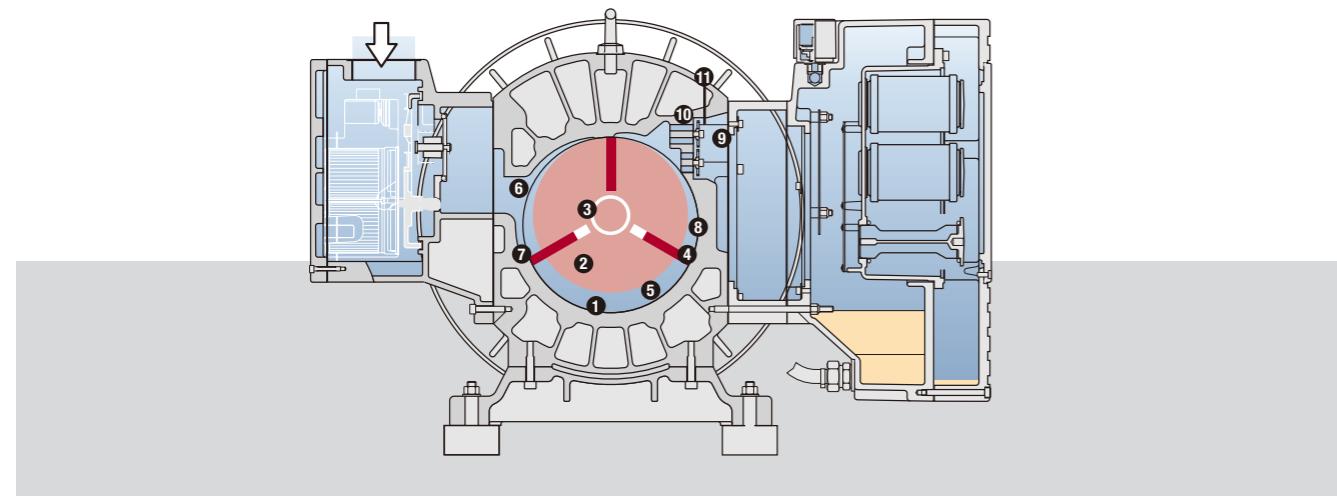

作为真空泵运行时，其过程相同，但气室（8）提供的是负压，腔体（9）内为大气压。

Pressure increase by volume reduction is the principle behind rotary vane operation. This static design offers excellent service in pressure, vacuum or a combination of both. Depending upon size and design - i.e. oil lubricated or dry running - vacuum up to 0.1 mbar abs with capacities ranging from 3 to 155 m³/hr can be reached. When used an a combined unit, 0.6 bar vacuum and 0.7 bar pressure can be achieved simultaneously.

In a cylindrical housing (1) a rotor (2) is positioned eccentrically so that it is on the top almost touching the cylinder. Rotor blades (4) are positioned into numerous rotor slots (3). When the rotor starts turning, due to centrifugal force the blades are thrown out and slide against the internal surface of the cylinder. In this way a cell (5) is formed between two blades with a volume that changes constantly during rotation. Air enters from the inlet port into a cell until the rear blade reaches the

inlet port (7). At this point the cell (5) has achieved its maximum air volume. As the cell then moves away from the port its volume becomes smaller and smaller, the air is thus compressed and the pressure rises. This continues until the pressure in the cell (8) exceeds that in the pressure chamber (9) and the air then exits through the outlet port (10). Some models are fitted with exhaust valves (11) which stop the backflow of this discharged air if the maximum pressure has been reached.

In a vacuum pump the process is similar, but the cell (8) gives decreasing pressure, and the chamber (9) is at atmospheric pressure.

罗茨泵
Roots

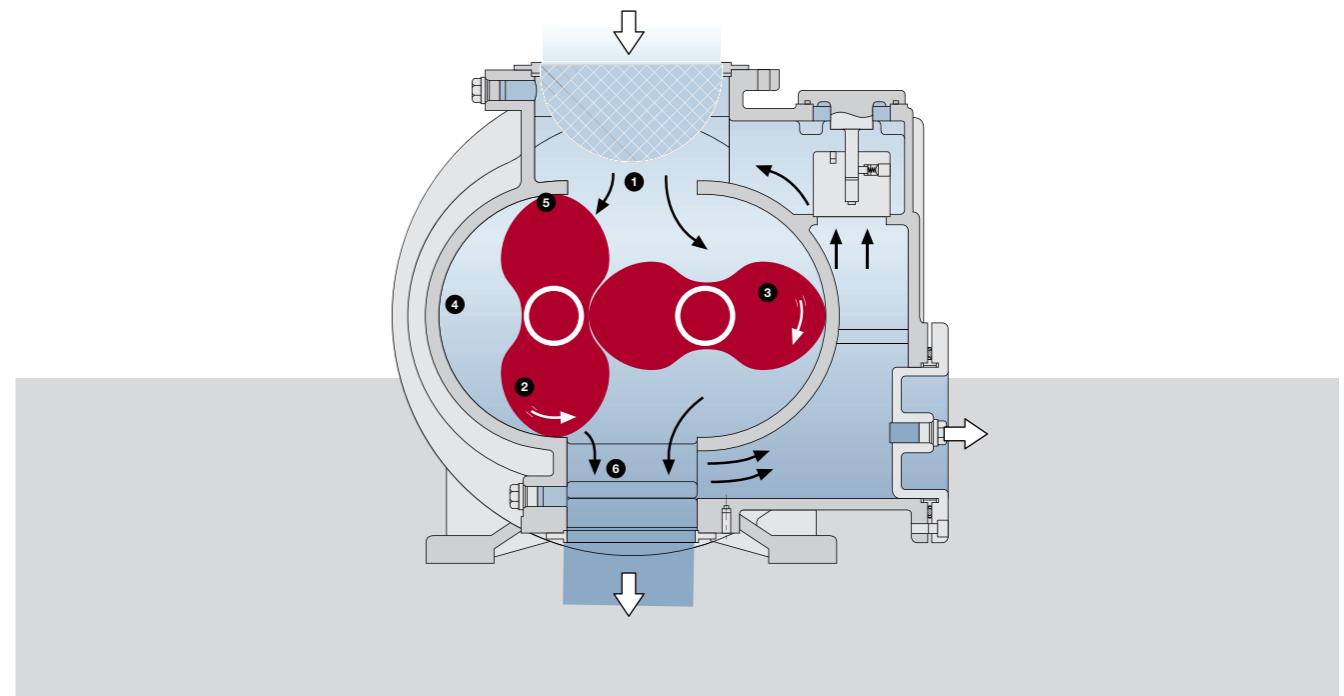

罗茨泵的设计原理 Operating Principle

与旋片泵相同，罗茨泵也是静态压缩系统，尽管其压力产生不是由于“内部”体积减少，而是因为旋片式罗茨风机的无接触式运行，没有被抽出气体污染的可能性。2级或3级罗茨真空泵SHARK，真空运行：0.5bar，压力运行：2bar，流量：20-8580m³/hr。

与旋片泵相同，气体从进口(1)进入腔体内两个转子(2)+(3)组成的气室，然后气室与进气口被随后的转子头(5)分开。在气室(4)中的气体被完全的输送，达到出气口(6)时，气室中的空气体积在传输中没有被减少，从压力腔中产生的绝对压力进入下一个气室，随后被排放，就在这个阶段输送过程中，“外部压缩”产生了。

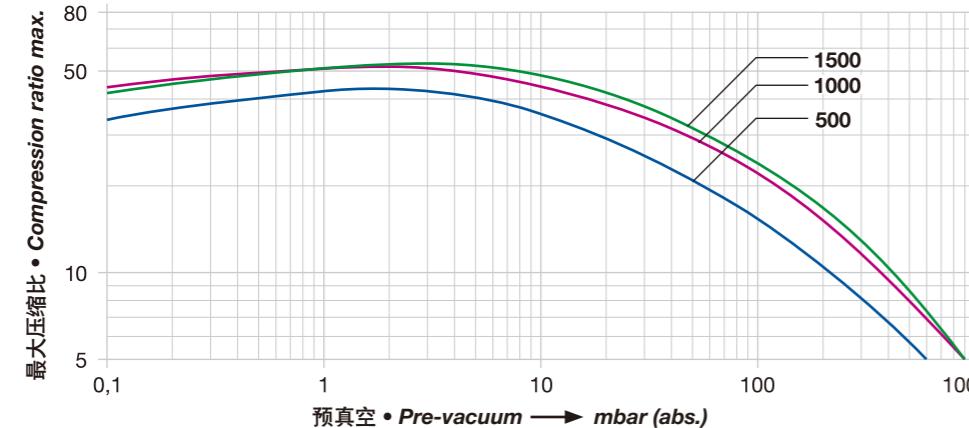

Similar to rotary vane pumps, rotary lobe vacuum pumps and blowers are also static compression systems, although the compression does not result from an »internal« volume reduction. Because of the non-contact operation of the rotary lobe blower, there is no possibility of contamination of the pumped gas. The two or three-lobed rotary blower SHARK is for vacuum operation to 0.5bar(abs.) and pressure operation to 2bar(abs.) at capacities of 20 to 8580m³/hr.

Similar to the rotary vane pump, air enters the inlet opening (1) into a conveying cell formed by the two rolling pistons (2) + (3) in the housing. This is until the cell is separated from the inlet by the following piston head (5). The air in the cell (4) is conveyed without reduction until it reaches the outlet (6), where air with a higher absolute pressure flows from the pressure chamber into the following cell, and must then be discharged. It is during this stage of the conveying that »external compression« takes place.

System solution

We would like to present to you our latest example of a tailor-made vacuum system

Task:

A mixture of

- Water
- Isopropan
- Ethanol
- Acetone

Has to be removed from a pharmaceutical dryer.

The special task hereby is to handle the extraordinarily large stream of rinsing gas at medium pressure.

The Elmo Rietschle solution

- Pre-condensation of the solvent fumes with the aim of reducing the size of the vacuum unit
- Use of a speed controlled screw vacuum pump
- Pressure is kept constant by changing the required pump speed
- Installation of an exhaust condenser
- ATEX configuration

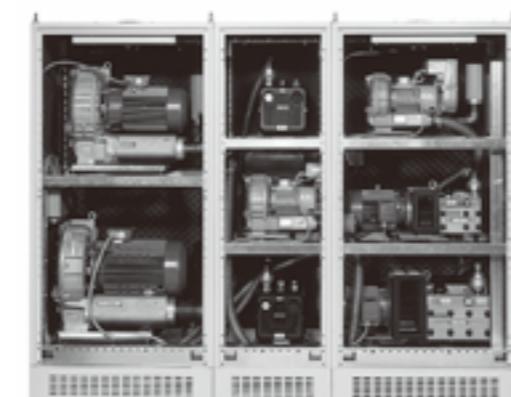

在印刷和造纸工业中，近几年有一种趋势，将大量的真空泵、压力泵和风机搬离印刷机。中央风柜作为一种标准开始进入这个领域，并拥有下面的优点：

- 可根据用气需求，采用模块化组合
- 改善生产环境安全，降低噪音污染
- 维护简单、方便
- 可以回收余热，减少供热成本

采用模块化组合和变频控制技术，可对每台泵和风机进行控制及调节，这样可使流量、压力能够满足任何印刷机的需求，同时具备下列优势：

- 能耗减少50%以上
- 因为低速运行，使得使用性更高并维护费用更低

控制软件可根据前端的生产负荷变化，例：印刷的材料、纸张的重量、印刷机速度变化等，通过调节变频器自动增加、减低负荷来匹配系统对用气变化的需求，同时，系统还具备手动操作模式，可有效减少生产准备时间。

In printing and paper processing industries. There has been a trend in the last few years towards installing a large number of vacuum pumps, compressors and blowers centrally, remote from the printing machines. The air-center has come into its own as a standard in this field, providing a lot of advantages, some of which are:

- Flexible adaptation to any air demand due to the modular assembly concept.
- Highly improved industrial safety and ergonomics by reduced noise pollution.
- Less time required for maintenance due to easy access to the machines.
- Reduced heating costs due to recovery of thermal losses.

Logical development has lead to the AIR-BUSLOGIX. The modular assembly concept makes it possible to control each pump or blower with the help of a frequency converter. Thus, volume flow and pressure will meet the demand at any location of any printing machine exactly. And there are side benefits:

- Up to 50% saving on energy costs
- Higher availability and less maintenance costs because of low speed operation

The control software provides the opportunity to store and load the setting of the frequency converter of each pump or blower, depending on the printing job (i. e. material to be printed, direction of printing, weight etc.). Manual adjustment is always possible, too. Another advantage offered by the software is to reduce make ready time.

Vacuum Conversion

Absolute pressure p (mbar abs.) can be converted to and from pressure difference Δp (inches Hg) based on atmospheric pressure of 1013 mbar abs. (= 760 Torr = 29.92 inches Hg abs.) using the following formulae:

$29.92 - 2.953 \times 10^{-2} \times p$ (mbar abs.) = Δp (inches Hg)

$1013 - 33.86 \times \Delta p$ (inches Hg) = p (mbar abs.)

真空换算

极限压力p (mbar 绝对压) 能换算成为压力差 Δp (inches Hg) 基于大气压力为1013mbar绝对压 (=760 Torr = 29.92 in Hg 绝对压)

可用以下方程式：

$29.92-2.953 \times 10^{-2} \times p$ (mbar 绝对压) = Δp (inches Hg)

$1013-33.86 \times \Delta p$ (inches Hg) = p (mbar 绝对压)
